

# BOHR

v0.3      2013/11/05

simple atom representation according to the Bohr model

Clemens NIEDERBERGER

<https://bitbucket.org/cgnieder/bohr/>

[contact@mychemistry.eu](mailto:contact@mychemistry.eu)

This package provides means for the creation of simple Bohr models of atoms up to the atomic number 112. Additionally commands are provided to convert atomic numbers to element symbols or element names and vice versa.

The package is inspired by a question on <http://tex.stackexchange.com/>: Draw Bohr atomic model with electron shells in  $\text{\TeX}$ ?

## 1 Licence and Requirements

Permission is granted to copy, distribute and/or modify this software under the terms of the  $\text{\LaTeX}$  Project Public License (LPPL), version 1.3 or later (<http://www.latex-project.org/lppl.txt>). The software has the status “maintained.”

The **BOHR** package loads and needs the packages `pgf`<sup>1</sup> [Tan10] and `cnltx-base`<sup>2</sup> [Nie13].

## 2 Options

Every option described in the manual can also be used as package option. Options are indicated as **option** and are all key/value like options. Some options can be set without value, too. Then

---

1. on CTAN as `pgf`: <http://mirrors.ctan.org/graphics/pgf/>

2. on CTAN as `cnltx`: <http://mirrors.ctan.org/macros/latex/contrib/cnltx/>

the underlined value is used.

### 3 Usage

**BOHR** is used like any other L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> package:

```
1 \usepackage{bohr}
```

The main command, `\bohr`, creates the models:

`\bohr[⟨num of shells⟩]{⟨num of electrons⟩}{⟨atom name⟩}`

The main command. The mandatory arguments take the number of electrons to be printed and the atom symbol that is printed in the center.

This is described best by an example:

```
1 \bohr{3}{Li}
```

There is not much more to it. Another example using the optional argument:

```
1 \bohr[2]{2}{\mathrm{Li}^+}
```

### 4 Customization

**BOHR** provides a handful of options to customize the appearance:

`\setbohr{⟨options⟩}`

Options are set in a key/value syntax using this command.

`insert-symbol = true|false`

Default: false

If set to true **BOHR** will insert the atomic symbol suiting to the given electron number if *no* third argument is given.

`insert-number = true|false`

Default: false

If set to true **BOHR** will use the appropriate number of electrons for the given element symbol in the third argument if *no* second argument is given. This of course only works if the third argument is one of the 112 element symbols.

## 4 Customization

`insert-missing = true|false` Default: false  
Sets both `insert-symbol` and `insert-number`.

`atom-style = {⟨code⟩}` (initially empty)  
This code will be placed immediatly before the third argument of `\bohr`. The last macro in it may need one argument.

`name-options-set = {⟨tikz option⟩}` (initially empty)  
This value is passed to the options of the `\node` the third argument of `\bohr` is placed in.

`name-options-add = {⟨tikz options⟩}` (initially empty)  
This value will be added to options set with `name-options-set`.

`nucleus-options-set = {⟨tikz options⟩}` Default: `draw=black!80,fill=black!10,opacity=.25`  
This value is passed to the options of the `\draw` command that draws the circle around the name-node.

`nucleus-options-add = {⟨tikz options⟩}` (initially empty)  
This value will be added to options set with `nucleus-options-set`.

`nucleus-radius = {⟨dimension⟩}` Default: 1em  
The radius of the circle around the name-node.

`electron-options-set = {⟨tikz options⟩}` Default: `blue!50!black!50`  
This value is passed to the options of the `\fill` command that draws the electrons.

`electron-options-add = {⟨tikz options⟩}` (initially empty)  
This value will be added to options set with `electron-options-set`.

`electron-radius = {⟨dimension⟩}` Default: 1.5pt  
The radius of the circles that represent the electrons.

`shell-options-set = {⟨tikz options⟩}` Default: `draw=blue!75,thin`  
This value is passed to the options of the `\draw` command that draws the circles that represent the shells.

`shell-options-add = {⟨tikz options⟩}` (initially empty)  
This value will be added to options set with `shell-options-set`.

`shell-dist = {⟨dimension⟩}` Default: 1em  
The distance between the nucleus and the first shell and between subsequent shells.

`language = {⟨language⟩}` (initially empty)  
Select the language used for the element names manually rather than letting `BOHR` select it automatically. This option must be used as package option or in the preamble in order to have an effect. Currently provided languages are English, French and German. If this option is not used the document language at the end of the preamble (as set by `babel` or `polyglossia`) is used.

Introduced in  
version 0.2d

Introduced in  
version 0.3

**distribution-method** = periodic|quantum

Default: quantum

Determines how the electrons are distributed on the shells. periodic distributes the electrons 2-8-8-18-18-32-32, *i. e.*, according to the place of the corresponding atom in the periodic table of elements. quantum distributes the electrons according to the electron configuration of the corresponding atom where each shell represents the main quantum number. Pd for example has the configuration  $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^6 4d^{10}$  and would get two electrons on the first shell, 8 electrons on the second, and 18 electrons each on the fourth and fifth.

```
1 \setbohr{name-options-set={font=\footnotesize\sffamily}}
2 \bohr{2}{He} \bohr{7}{N}
```

```
1 % uses package 'chemmacros'
2 \setbohr{atom-style={\footnotesize\sffamily\ch}}
3 \bohr{0}{H+} \bohr{10}{F-}
```

```
1 \setbohr{
2   shell-options-add = dashed,
3   shell-dist       = .5em,
4   insert-missing
5 }
6 \bohr{6}{} \bohr{}{K}
```

## 5 Additional Commands

**BOHR** provides some additional commands that return the element symbol or the element name to a given atomic number and vice versa.

`\elementsymbol{⟨atomic number⟩|⟨element name⟩}`

Returns the element symbol for a given atomic number or element name. `\elementsymbol{80}`: Hg; `\elementsymbol{rhenium}`: Rh.

`\elementname{⟨atomic number⟩|⟨element symbol⟩}`

Returns the element name for a given atomic number or element symbol. `\elementname{80}`: Mercury; `\elementname{Rh}`: Rhenium.

`\atomicnumber{⟨element name⟩|⟨element symbol⟩}`

Returns the atomic number for a given element name or element symbol. `\atomicnumber{Hg}`: 80; `\atomicnumber{rhenium}`: 75.

`\Z`

If this command isn't defined by some other package it is available as an alias of `\atomicnumber`.

1 The elements `\elementname{F}`, `\elementname{Cl}`, `\elementname{Br}`,  
2 `\elementname{I}` and `\elementname{At}` are called `\emph{halogens}`.

---

The elements Fluorine, Chlorine, Bromine, Iodine and Astatine are called *halogens*.

## 6 Internal Commands

The element properties used by **BOHR** are defined through the following commands:

`\DeclareAtomSymbol{⟨atomic number⟩}{⟨atom symbol⟩}`

The package file contains 112 lines like the following: `\DeclareAtomSymbol{29}{Cu}`. They associate atomic number with the corresponding atom symbol. This command could be used to change an element's symbol.

`\DeclareAtomName{⟨atomic number⟩}{⟨element name⟩}`

**BOHR** comes with a few language files named `bohr_elements_⟨language⟩.def`. They contain of 112 entries like `\DeclareAtomName{29}{Copper}` which associate atomic number and element name. This command could be used to change an element's name.

`\DeclareElectronDistribution{⟨atomic number⟩}{⟨electron distribution⟩}`

The `⟨electron distribution⟩` is a comma separated list of integers which determines how the electrons are distributed on the shells when `distribution-method = quantum`. The package file contains 112 entries like `\DeclareElectronDistribution{29}{2,8,18,1}`. This command could be used to change an element's electron configuration.
